

Solution Architecture

Date	05 July 2026
Team ID	
Project Name	Personalized Networking Assistant
Maximum Marks	4 Marks

Solution Architecture:

The Solution Architecture for the Personalized Networking Assistant provides an AI-powered framework for helping users build meaningful professional connections. Its goals are to:

1. Develop an intelligent networking assistant using AI and NLP.
2. Process user profiles and event details to generate personalized conversation starters.
3. Analyze event themes using DistilBERT and verify information through Wikipedia API. Support scalable cloud deployment for reliable and accessible networking assistance.

Example - Solution Architecture Diagram:

Component Description Table

Component Name	Description / Role in Architecture	Technologies Used
Presentation Layer	Provides a user-friendly interface where users register, enter profile details, select events, receive AI-generated conversation starters, and view conversation history.	Streamlit, HTML, CSS
API Gateway	Receives requests from the presentation layer, validates user input, processes profile and event information, communicates with AI models, and returns personalized responses.	FastAPI, Python
AI Services	Performs event theme analysis, generates personalized conversation starters, verifies facts, and provides networking recommendations.	DistilBERT, GPT-2, Transformers, Wikipedia API
Database	Stores user profiles, conversation history, event information, and feedback for future recommendations.	SQLite, JSON, Pandas
